

METRO CENTER SALES CENTER

Location: Washington, DC - WMATA has upgraded its sales center at the Metro Center Station. The new booth, double the size of the 1970's facility, is located on the mezzanine of the station. LT first analyzed the existing structure to confirm that the location can support the new facility. The booth is designed to be bullet resistant and it has a significant amount of armor plate making it very heavy. As the building is within the station all materials had to come on the work train through the tunnels presenting size limits on the materials. The booth was designed to be fabricated in components and assembled on site. The finishes reflected WMATA's updated design aesthetic for stainless steel over the original dark bronze finish. The project was designed to be built in two phases allowing the sales booth to maintain services throughout the upgrade.

SIZE: 1200SF
